

Further discussions and roadmap

We have to start incorporating Orbis store instead of storing all data on smart contract

We have to get GIF v3 ready and deployed on the test chain

Add Pimlico or similar service for account abstraction

We did a POC on privy but it stores the social login or email. We are considering a solution where email domain is verified using ZKEmail and storing the hash of email on decentralized store to prevent duplication

Kleros doesnt offer total privacy and documents will be visible to the Jury. We are considering a solution where we load the merged documents in an iframe inside nebula app and provide the URL of the same as meta evidence link to kleros. The iframe is allowed to be loaded only on nebula and kleros domain to offer further protection

What we are confident about now?

- We have successfully build and tested client side encryption, decryption of data and files using Lit protocol
- We were able to do decentralized computation using Lit Action
- We were able to store and retrieve data from Irys
- We were able to integrate Kleros with GIF v2
- We were able to deploy GIF v2 and buy policies, make claims and generate payout
- We were able to integrate Privy with React and build onboarding workflows

What are the risks ?

- We managed to deploy GIF v3 on local but was not successful in interacting with it
- We have to integrate the new workflow with Kleros and v3

What are pending modules?

- Agent workflow
- Marketing work flow
- Recurring payments
